# COTTON LEAFWORM

(*Alabama argillacea* (Hbn.))

## Injury and Life History

The cotton leafworm is a tropical insect not known to survive the winters in the United States. New infestations are started each spring by moths that fly in from the South and lay their eggs on cotton. The first leafworms generally appear in April, May, or June, usually in southern Texas but sometimes in Florida. As the leafworms increase in numbers, the moths fly to other areas, and in some years all the cotton States except California are invaded. The moths often reach the Northern States and Canada and feed on ripe fruit, such as peaches or grapes. The larvae, or "worms," feed only on cotton. The small leafworms feed on the under side of the leaves and do not cut through the upper surface. The larger worms eat the entire leaf and when abundant completely strip, or "rag," the leaves and then gnaw on the squares, bolls, and bark until the field looks as if it had been swept by fire. The brown pupae are formed within a folded leaf or are attached by a silken cord to the stems and ribs of the leaves.

The spread of the leafworm varies greatly from year to year. Although damage is usually greater west of the Mississippi River, control is often needed in the Eastern States. Early ragging of the plants prevents bolls from maturing and causes reductions in the yield and quality of the cotton. The stripping of the leaves by leafworms after most of the bolls are mature may be beneficial in preventing boll weevils from increasing and in keeping the bolls from rotting on rank cotton by admitting more sunlight to the plants and permitting better circulation of air.

## Control

Small cotton leafworms can be controlled very easily by dusting or spraying with any of the arsenical insecticides. Large worms are more difficult to control and may cause considerable stripping before they are killed. Dusting with 5 to 7 pounds per acre of calcium arsenate or lead arsenate will control leafworms. Lead arsenate applied as a spray at the rate of 4 to 6 pounds in 50 gallons of water for each 3 acres is also satisfactory. If a quick kill of large worms is needed to prevent stripping, add 7 or 8 pounds of paris green to each 100 pounds of calcium arsenate, or use 8 to 10 pounds of paris green with 100 pounds of lime.
